Establish stable supply for consumers with secure, safe, and authentic agricultural produce.

Innovative farming method for the quality of water

The Background of this method

Up to the present, healthy agricultural produce has been of secondary importance because the current agriculture rely on chemical fertilizer and pesticides.
We preserve our health by ingesting healthy food.
In addition, water is essential to grow and preserve health for all of organisms including human beings.We are completely particular about water, not chemical fertilizer nor pesticides.We contribute healthy agricultural produce by HIET which is the equipment to qualify the water by activating water molecular vibration.
*In comparison with ordinary tap water, the diffusibility and conductivity of heat is 106%, and the viscosity is 97%.This is why the water is transformed to be more permeable and absorbent.

The reason HIET is chosen

☑ Easy installation

Only 4 steps to install.
You can use HIET with no maintenance semi permanently.

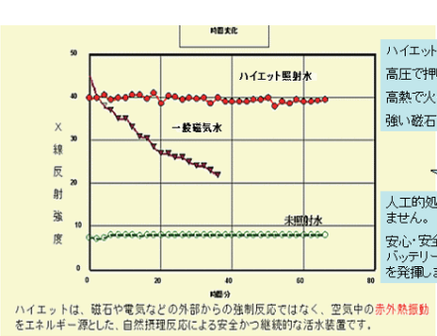

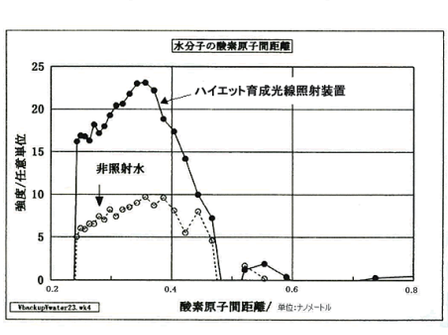

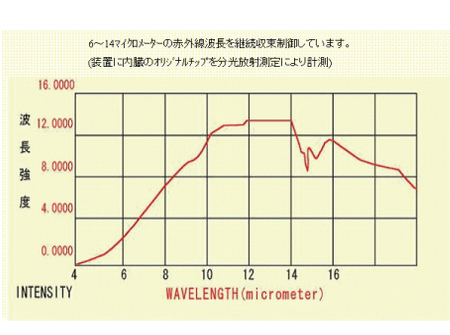

☑ Long efficacy compared with magnetic water.

☑ The number of free molecules are double compared with tap water.

☑ Continuously irradiate extreme infrared light ray.

The function of HIET

HIET inwardly irradiates high efficient growth light ray that is safe and weak vibration energy.
HIET is contactless to the water, semi permanently effective, and maintenance free.
The high efficient growth light ray activate water molecules to be free by resonating with them.
This is why the water is transformed to be more permeable and absorbent.

*The Japan Society of Applied Physics , and Thermophysical Properties announcement

What is High Efficient Growth Light Ray?
It was found by NASA and a necessary ray for human beings to alive.It is defined as 4-14μm extreme infrared radiation.
By resonance with molecule of human body, it activates blood flow and cells.

Proven over 20 years.
More than 600 agricultural producers use HIET.

Please try first!

There is 90-days-trial. (Defined as lease)
Please watch and confirm that your crops are grown healthy.
There is free support for installation and maintenance during the trial period.If necessary, consultation for cost reduction or development of market is also available.
