

Galilee International Management Institute, Agriculture and Environment Centre's

Integrated Water Resources Management Programme

21 October - 4 November, 2015

We have all heard that water is life, and indeed it is. What is often ignored, however, is the fact that water is also a key component of development. Unfortunately, water has been taken for granted in too many countries for too long. In Israel, a small semi-arid country, we never had the luxury of taking water for granted. Under the pressure of limited rainfall and few water resources, coupled with a rapidly growing population, the country's water management and technology have become the most efficient and cost effective in the world. This programme aims to share these developments.

- Integrated Water Resources Management
- Water and National Economic Development
- Water Supply and Distribution
- Cost Effective Technologies for Minimising Water Loss
- Effective Regulation of Water
- Water Utility Regulation
- Protection of Precious Water Resources
- Climate Change and its Impact on Water
- Sustainable Sourcing and Water Replenishment
- Pollution Control and Prevention of Waterborne Diseases
- Ensuring Water Quality
- Wastewater Treatment and Recycling
- Safe Water Reuse for Productive Agriculture
- Storm Water Management
- Desertification Abatement
- Encouraging Water Conservation with Policy
- Water Supply Economics
- Searching for New Sources of Water
- Predictions of Water Scarcity, Being Prepared
- Project Management Workshop
