

## Le CEBRE

### Center biological purification and of ecological recycling of wastewaters

#### Concept of Cleansing "Organic Town hall"

An approach different from the Collective treatment of wastewaters

The CEBRE is a tool for biological treatment of purification of domestic waste water, who works with an element « alive' », invisible, specific and dominating that is the bacterium of biological breakdown that one finds in the basic principle of operation of the process "Biological Pit" lyseconcept.

The CEBRE eliminates very easily and quickly a diffuse pollution from waste waters by individual biological treatment contrary to the collecting system of the collective cleansing which by the regrouping of the aforesaid pollution, in a given place, a strong concentration of that generates Ci, making it impossible to eliminate in time and hour limited by the flow.

The CEBRE removes the diffuse pollution of micro the pollutant chemical.

The CEBRE removes the collective cleansing in its current design of extension and renewal.

The CEBRE transfer the competence and financial costs of the public cleansing towards the more economic private individual of manner.

The CEBRE is established with the request by successive stage for tiny financial costs.

The CEBRE adapts to all the situations according to the effluents to treat.

The CEBRE reduces the cost of treatment of wastewaters and household wastes as a whole.

A saving in 100 billion d'€ over 10 years.
