

Introducing: **Water Filter Media of Granulated Ceramics**

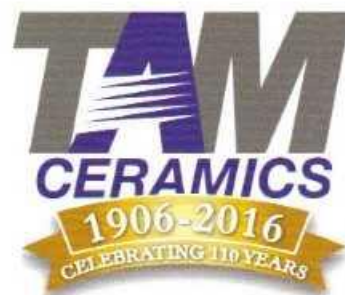

- silver treated
- variable log effectiveness
- custom sizing
- community sized filters

TAM's water filter systems use treated granulated ceramic as the filter media and can be made in any size to meet the needs of every community. They reduce pathogens in water using nothing more than gravity, eliminating the need for chemicals, electricity, and other technology of any kind.

The filter material is available in bulk at percentage effectiveness ranging from 99.90% (log 3) to 99.99999% (log 7). The percent effectiveness of the media is determined by the amount of silver used during treatment.

We are happy to provide recommendations as to filter containment system design upon request.
