

MIH Water Announces Completion of Successful Pilot Program

August 20, 2020

MIH Water Treatment, Inc. (MIH) announces the successful completion of a Hall BioProcess™ pilot program for the treatment of groundwater with the San Antonio Water Company (SAWCO), a mutual water company in Upland, California. The pilot study successfully demonstrated the biological removal of nitrate in contaminated groundwater, which will greatly improve the quality of drinking water and enhance local water supplies. The Division of Drinking Water (DDW) of the State Water Resources Control Board of California reviewed and approved the results of the pilot study. Using the patented Hall BioReactor™, contaminated groundwater was continuously treated for the removal of nitrate readily meeting strict State quality standards for drinking water.

Peter Hall, Chief Technical Officer of MIH, stated, “This is another important milestone for both our Company and the industry. Advancements in the biological treatment of groundwater contamination has many advantages over conventional treatment methods, not just in terms of cost. It is a process which occurs naturally. The Hall BioReactor™ is unique in its ability to harness this natural process to treat a range of contaminants, safely and reliably. We are delighted to have partnered with SAWCO on this pilot and thank them and DDW for their tremendous support.”

Brian Lee, General Manager of SAWCO stated, “Groundwater contamination is a significant challenge for the region. Our job as stewards of this important community resource is to ensure we have adequate supply of quality drinking water for our customers, both now and well into the future. Advancements in groundwater treatment will help enhance our available water supplies to continuously meet those needs.”

About MIH Water Treatment, Inc.

MIH provides advanced biological water treatment technology and services, which enhance the availability of scarce groundwater supplies for drinking water and improves the quality of regional aquifers. MIH utilizes the Hall BioProcess™, a patented, revolutionary and environmentally friendly biological water treatment solution for the removal of nitrate, perchlorate, and other hazardous contaminants from groundwater. The Hall BioProcess™ has proven to exceed the efficiencies of conventional technologies with lower cost and smaller footprint, without hazardous waste stream or byproducts.
