From: “MODUL SOLAR-BG” LTD

To: ALL INTERESTED PARTIES

Dear Sirs,

Our company produces and distributes organic fertilizers for your farm. We offer universal organic fertilizers of a new generation.

Fertilizers are produced in two forms - liquid concentrate in bottles and dry friable fertilizers in bags.

The main component for the production of fertilizer is organic matter from animal waste, obtained by decomposition of organic substances into simpler ones. At the same time, all the necessary mineral components are preserved, the entire pathogenic microflora is destroyed, and also is performed splitting and transfer of heavy metal salts into a non-toxic form. In the production process not used any "chemistry" and GMO.

With the use of patented technology, we can produce fertilizers in two forms - **liquid** concentrate and **dry** friable fertilizers.

Adding our fertilizer into the soil decides a number of problems such as:

- Restoration of soil fertility;
- Improvement of the physical composition of the soil;
- Increase in yields;
- Decrease in application of fertilizers in the first year by 10%, subsequent 30-50%;
- Restoration and activation of useful microflora of the soil;
- Acceleration of the decomposition of solid plant residues to humus-like substances, saturation of the soil with humus;
- Suppression of putrefactive and pathogenic microflora;
- Binding of pesticide residues in soil.

The organic fertilizers offered by us consist entirely of "organics", necessary not only for plants, but also as loosen the soil and feed for microorganisms, insects and earthworms, which produce biohumus and other useful (natural) substances.

The proposed fertilizers are compatible with any pesticides, give energy of germination of seeds and strengthen the immune system of plants, allow to increase the yield with a significant reduction in the use of mineral fertilizers and fungicides, increase the resistance of plants to stress, such as freezing, drought, transplantation; increase the resistance of plants to diseases; acting directly on the microbiological composition of the soil, allow fertilizer to activate the synthesis and outflow of nutrients and biologically active substances from the leaf to the fruit and strengthen the root formation.

The mission of the company is the implementation of a complex of measures to increase the fertility of lands using organic fertilizer of the NEW GENERATION of the past processing with the addition of the humic complex, which is a powerful biostimulator, and a consortium of effective soil microorganisms.

If there is interest on your part, we are ready to provide you with detailed information on the proposed production.

With respect:

Veselin Dimitrov
Plamen Paskalev
