Maintenance

Cleaning the Merlin Eco-Solutions Water Purifier's filters is quick & easy. When the flow of potable water slows it is easy to clean the filters by following the steps shown in the photos. With proper care and maintenance of the filter system(s) your Merlin Eco-Solutions Water Purifier can provide a sustained flow rate of 60*gallons of purified, potable water per hour or about 1 gallon per minute.

Merlin Eco-Solutions Water Purifiers are shipped assembled and designed to be easy to use and maintain. The two filters and the U.V. lamp are durable and long-lasting. The filters will process about 500,000 gallons of water before needing to be replaced.

Step 1

Step 2

Cleaning the Merlin Eco-Solutions Water Purifier

Cleaning the Merlin Eco-Solutions Water Purifier's filters is quick & easy. When the flow of potable water slows, it is easy to clean the filters by following the steps shown in the photos.

To clean the ceramic water filter, simply use the tool provided to remove the cover, and scrub filter as directed. Replace the filter and put cover back in place with the provided tool.

*****However, it is important and vital that this is done as frequently as needed to insure the flow rate of the purifier.*****

*Actual flow rates vary based upon condition of water source and/or filter. Sources with heavy deposits of sediment or other impurities may require more frequent cleaning of filter(s) to maintain flow rate.

To clean the sediment filter, simply remove the cap (turn counter clockwise), remove the filter, rinse in clean water and replace.
