COMPANY PROFILE

The activity of ECOPLUS is based on solid foundation of 40 years' experience in the treatment of various effluent, combined with a constant passion for our job and the professionalism of our team.

Our core activity of engineering, manufacture and supply of effluent treatment plants has been developed and applied to numerous industrial sectors, including civil waste and water potabilization plants.

Combining ECOPLUS' experience and a continual process of utilising technological advancements has enabled us to realize treatment plants using either partial or entirely PURIFIED WATER.

APPLICATION FOR SLAUGHTERHOUSES

Continued research and development on the engineering side of our business has resulted in the successful application of our equipment in Abattoirs.

The use of specialized equipment and technology is required to address and manage the presence of solids, fats and organic matter in the waste water generated by abattoirs.

The biological element of the treatment plant is vitally important to the removal of organic pollution (BOD) from the wastewater through the action of specific bacteria, ensuring that surplus water is safely discharged in compliance with environmental regulations or is re-cycled and used for floor and/or tool washing.

Our engineering and mechanical facility specializes in the handling of stainless steel and produces a range of equipment, namely:

1. **SCREW SCREEN**
2. **DAF Flotation Units**
3. **Biological processes MBR, SBR, MBBR**
4. **SLUDGE PRESSES**
